

Homework 6

CS 5114 (Fall 2018)

Assigned on November 5, 2018.

Submit PDF solutions on Canvas by the beginning of class on November 12, 2018.

Instructions:

- The Graduate Honor Code applies this to homework. In particular, you are not allowed to consult any sources other than your textbook, the slides on the course web page, your own class notes, and the instructor. Do not use a search engine.
- Do not forget to typeset your solutions. *Every mathematical expression must be typeset as a mathematical expression, e.g., the square of n must appear as n^2 and not as “ n^2 ”.* You can use the L^AT_EX version of the homework problems to start entering your solutions.
- Describe your algorithms as clearly as possible. The style used in the book is fine, as long as your description is not ambiguous. Explain your algorithm in words. A step-wise description is fine. *However, if you submit detailed code or pseudo-code without an explanation, we will not grade your solutions.*
- Do not make any assumptions not stated in the problem. If you do make any assumptions, state them clearly, and explain why the assumption does not decrease the generality of your solution.
- Do not describe your algorithms only for a specific example you may have worked out.
- You must also provide a clear proof that your solution is correct (or a counter-example, where applicable). Type out all the statements you need to complete your proof. *You must convince us that you can write out the complete proof. You will lose points if you work out some details of the proof in your head but do not type them out in your solution.*
- Describe an analysis of your algorithm and state and prove the running time. You will only get partial credit if your analysis is not tight, i.e., if the bound you prove for your algorithm is not the best upper bound possible.
- You will also get partial credit if your algorithm is not the most efficient one that is possible to develop for the problem.
- In general for a graph problem, you may assume that the graph is stored in an adjacency list and that the input size is $m + n$, where n is the number of nodes and m is the number of edges in the graph. Therefore, a linear time graph algorithm will run in $O(m + n)$ time.

Additional notes.

- For many of the problems in this homework, you will reduce the given problem to one of the flow-related problems we solved in class. Make sure you describe the reduction completely. For example, if you reduce a problem to the maximum network flow problem itself, specify clearly how will convert an input to the original problem into a flow network (nodes, source and sink, edges, directions, and edge capacities). Do not forget to prove the correctness of your solution in both directions, as we did in class (lest you transmogrify Calvin-sized Hobbes into a dinosaur).
- For some of the problems in this homework, you do not have to reduce the problem “all the way” to computing the maximum flow in a network. A reduction to maximum bipartite matching or to minimum cut may suffice. You can then use the polynomial time algorithms we have developed for these problems to solve the original problem. In other words, you do not have to also describe how to reduce maximum bipartite match matching or minimum cut to the maximum flow problem.

Problem 1 (10 points) Solve exercise 5 in Chapter 7 (page 416) of your textbook.

Problem 2 (15 points) You are given a flow network $G = (V, E, c, d)$. Here the function $c : E \rightarrow \mathbb{Z}^+$ specifies the positive capacity for each edge. In addition, the function $d : V \rightarrow \mathbb{Z}$ is a function that specifies the maximum incoming flow for each node, i.e., for every node v , the total value of the flow coming into v cannot be larger than $d(v)$; note that $d(v)$ may be zero for some nodes. Given a source s and a sink t , develop an algorithm to compute the maximum flow in this network. You may assume that $d(s) = 0$ and $d(t)$ is unbounded.

Problem 3 (30 points) Solve exercise 6 in Chapter 7 (pages 416–417) of your textbook.

Problem 4 (45 points, 30 points for part(a) and 15 points for part (b))¹ Solve exercise 19 in Chapter 7 (pages 425–426) of your textbook.

¹For part(b), you need to modify the solution for part (a), so the 15 points are for this modification.
